

Integrated Master-PhD Track

2025-2026

YEAR 2

CONTROL AND ROBOTICS

SIGNAL AND IMAGE PROCESSING

PROGRAMME SUPERVISOR:

Pierre-Emmanuel HLADIK

YEAR 2 - Autumn Semester

CORE COURSES

Course code	Title	ECTS Credits
REPRO2	Research Project 2	8

ELECTIVES COURSES (five modules from a choice of six)

Course code	Title	ECTS Credits
BIOSIM	Biomedical Signals, Images and Methods	4
DESIRE	Design of Signal and Image Representations	4
LEARN	Machine Learning, Data Analysis and Information Retrieval	4
MATSIP	Mathematical Tools for Signal and Image Processing	4
SIRIM	Signal and Image Restoration, Inversion Methods	4
STATES	Statistical Signal Processing and Estimation Theory	4

LANGUAGE COURSES (one module from a choice of three)

Course code	Title	ECTS Credits
CCE3	Cultural and Communication English	2
ESP3	Spanish Language	2
FLE3	French Language	2

YEAR 2 - Spring Semester

CORE COURSES

Course code	Title	ECTS Credits
THESIS	Internship / Thesis project	30

YEAR 2 - Autumn Semester

Research Project 2 [REPRO2]

LEAD PROFESSOR(S): Pierre-Emmanuel HLADIK

This project will be devoted to preparatory work for the Master's thesis, which will take place in the second semester.

The main stages are:

- a bibliographical study to identify the key points of the subject and its main difficulties
- setting up the research approach: detailing the various stages and a work plan
- defining the theoretical, numerical or experimental methods required for the research work

This project will be assessed through a written report and an oral presentation.

Assessment

Individual assessment: EVI 1 (coefficient 1)

Language of instruction	ECTS Credits	Lectures	Tutorials	Lab	Project	Exam

Biomedical Signals, Images and Methods [BIOSIM]

LEAD PROFESSOR(S): *Clement HUNEAU*

Objectives

These introductory lectures to biomedical imaging aim to prepare the students for today's challenges and growing opportunities in computer-aided biomedical solutions.

At the end of the course the students will be able to:

- Describe the functioning principles of different biomedical imaging systems such as: X-ray, electrophysiology, magnetic resonance imaging and ultrasound, etc.
- Recognize the fundamental problems in medical image analysis, including the need for filtering, segmentation and registration.
- Describe different methods to solve the problems above.
- Use Python language to implement and run such solutions.

Course contents

Introduction

- History of biomedical imaging
- Structural vs functional imaging and some physiology

Biomedical measurement techniques

- X-ray, positron emission tomography
- Ultrasound
- Electrophysiology
- Magnetic resonance imaging

Biomedical image processing

- Segmentation
- Filtering
- Registration
- Tomography

Practical hands-on sessions

Course material

- N. Paragios, N. Ayache & J. Duncan. Biomedical Image Analysis: Methodologies and Applications, Springer, 2010.
- Jerry I. Prince: Medical imaging signals and systems textbook second edition 2014

Design of Signal and Image Representations [DESIRE]

LEAD PROFESSOR(S): Sébastien BOURGUIGNON

Objectives

Extracting relevant information from a data set is a key issue data processing. For example, the use of specific methods is crucial for the detection of events in noise, denoising, inpainting, data compression, extraction of characteristic features for machine learning and classification.

This course introduces a set of mathematical (both analytical and numerical) tools for representing a signal, an image or, more generally, a data set in one or several dimensions, in order to extract the meaningful and useful information contained within. Different tools are presented, both in their mathematical and informational foundations and in their practical implementation, through application examples taken from real data analysis problems.

Starting from Fourier-based representations, time-frequency and time-scale representations are introduced for the analysis of non-stationary data. Multiscale analysis (in particular, based on wavelet transforms) is detailed. Then, a second part is dedicated to the recent framework of sparse representations, which generalise the former representations to more complex problems, in particular adapted to big data processing. Both information theory and algorithms are studied (greedy methods, convex optimization, combinatorial optimization) in order to understand the main concepts and limitations, with applications ranging from denoising to inpainting, compressed sensing and dictionary learning.

Course contents

Time-scale analysis and wavelet transforms. Theory and practice of wavelet transforms. Orthogonal transforms, standard wavelet transforms. Har and soft thresholding. Lab: Discrete Wavelet Transform and multiscale analysis; application to signal denoising and image compression.

Sparse representations. Toward more general models. Interest of non-orthogonal transforms. Redundant dictionaries (unions of bases, wavelet packets). ESTimation and the l_0 "norm". Convex optimization based on the l_1 -norm. Greedy algorithms. Information theory, sparse recovery and compressed sensing. Towards dictionary learning.

Lab: Sparsity-aware denoising: different models and appropriate algorithms.

Course material

Machine Learning, Data Analysis and Information Retrieval [LEARN]

LEAD PROFESSOR(S): Diana MATEUS LAMUS

Objectives

After reviewing the key notions of machine learning seen during ARTIN (M1), this course will deepen into more elaborate approaches for unsupervised representation learning and dimensionality reduction. Then, the focus will shift towards supervised approaches with Neural Networks (NN). The course will present the basics of NNs, convolutional NNs and Graph NNs.

The sessions will alternate between lectures, seminars and mini-projects in Python, in which we will review the most influential NN architectures for image classification and object recognition. Seminars will also cover broader challenges (societal, economic and other) of current machine learning approaches. Although the techniques will be presented from a broad and general perspective, the applications will focus on images, biomedical data, and sound processing.

At the end of the course the students will be able to:

- Extract relevant features from large databases
- Run advanced machine learning algorithms for solving computational problems

Course contents

- Review of main machine and deep learning concepts
- Neural networks and convolutional Neural Networks
- Linear and non-linear methods for dimensionality reduction
- Graph neural networks
- Experimental protocols for learning

Course material

- Bishop C.: Pattern Recognition and Machine Learning. Springer, 2006.
- Kevin P. Murphy, "Probabilistic Machine Learning" MIT Press, 2022
- Francois Cholet. Deep Learning with Python. [2022]

Mathematical Tools for Signal and Image Processing [MATSIP]

LEAD PROFESSOR(S): Said MOUSSAOUI

Objectives

This course focuses on scientific computing and numerical optimization methods that are used in signal and image processing. It firstly provides a theoretical description of the methods and then addresses some examples such as non-linear curve fitting, image restoration and applications in modern signal processing problems.

At the end of the course the students will be able to:

- Formalize an optimization problem
- Choose an appropriate algorithm to solve an optimization problem

Course contents

- Introduction to scientific computing tools: Matlab, Python
- Unconstrained optimization (basic concepts, differential calculus, mathematical properties, optimality conditions, iterative methods, descent direction, line search, trust region)
- Constrained optimization (exterior penalty methods, interior-point methods, applications to image restoration)
- Global optimization interval methods, evolutionary methods, Monte Carlo methods)

Course material

Signal and Image Restoration, Inversion Methods [SIRIM]

LEAD PROFESSOR(S): Jérôme IDIER

Objectives

Inverse methods are used when information about an object under study is acquired indirectly, by measuring the effects of a physical phenomenon from which the causes are searched. This measurement principle is encountered in many applications: optics, acoustics, medical imaging, oceanography, astronomy, nondestructive control of materials, ... Such a methodology is used in most imaging methods, where a map of the physical properties inside an object is searched from measurements acquired from outside (e.g., X-ray tomography, or CT scan). This is also the case for methods aiming to restore a signal, an image, a data set from a version that was downgraded, noisy and filtered by the acquisition device (e.g., PSF of a microscope or of a telescope).

This course shows basic and more advanced tools which enable one to address an inversion problem, from the definition of the direct problem (physical modeling) and general information theory elements (incomplete data, ill-posed problem, statistical inference), the resolution principle essentially based on regularization, up to the efficient numerical computation of the solution by dedicated algorithms.

Course contents

- General points: ill-posed problems, regularization, a priori information
- Deconvolution: standard (linear) methods, quadratic regularization
- Non-linear methods, spike train deconvolution, sparsity
- Image restoration and tomography

Course material

Statistical Signal Processing and Estimation Theory [STATES]

LEAD PROFESSOR(S): Eric LE CARPENTIER

Objectives

This course addresses the characterization and the processing of random signals by means of statistical tools. It provides the theoretical foundations used in practical problems to estimate a quantity of interest and to retrieve sought information.

Applications concern: biomedical signal and image processing (diagnosis, tools to assist the disabled), music signal processing (recording, restoration, coding), positioning systems, etc.

At the end of the course the students will be able to:

- Provide a statistical description of a random process
- Solve a statistical estimation problem in a practical situation
- Derive a numerical algorithm to calculate and to characterize the solution

Course contents

- Probability theory: random vectors, density, mean, variance.
- Time analysis, frequency analysis: random signals, autocorrelation, power spectral density.
- Classical estimation Theory, Bayesian estimation: maximum likelihood (ML) estimation, minimum mean square error (MMSE) estimator, maximum a posteriori (MAP) estimator, linear minimum mean square error (LMMSE).
- Expectation–Maximization algorithm (EM)
- Markov chains, Markov processes
- Statistical filtering: Kalman

Course material

- Probability, Random Variables and Stochastic Processes. A. Papoulis, S.U. Pillai. McGraw Hill.
- Fundamentals of Statistical Signal Processing, Vol.1: Estimation theory, S. Kay, Prentice Hall.

YEAR 2 - Autumn Semester

Cultural and Communication English [CCE3]

LEAD PROFESSOR(S): David TROYA

Objectives

Team-building and Communicational English:

- Understand the general concepts of team-building
- Build a team-building project
- Understand and nurture the creative process
- Enhance self-belief and self-empowerment

Behavioral skills in an inter-cultural environment:

- Strengthen self-confidence and capacity for interaction
- Develop active listening and reformulation skills
- Develop networking skills

Course contents

Cultural and Communicational English: exercises to explore in practice the areas of culture and communication

Field-related or inter-cultural project (for example, construct content for inter-cultural teambuilding activities; example WIOBOX website etc).

Course material

Written and televised press, information and digital tools, general documents business environment and company strategies. Internet conferences (Ted Talks, etc.), our own educational materials on Hippocampus (Moodle).

Assessment

Individual assessment: EVI 1 (coefficient 1)

Language of instruction	ECTS Credits	Lectures	Tutorials	Lab	Project	Exam
English	2	0 hrs	16 hrs	0 hrs	0 hrs	0 hrs

Spanish Language [ESP3]

LEAD PROFESSOR(S): Marta HERRERA

Objectives

For beginners:

- Practice and reinforcement of the five skills (oral and written expression and comprehension as well as interaction) – Acquisition of vocabulary and linguistic structures
- Be able to talk about yourself and those around you Be able to express oneself during daily activities Know how to give your opinion

For advanced students:

- Practice and reinforcement of the five skills (oral and written expression and comprehension as well as interaction) Acquisition of specialised vocabulary
- Be able to understand the essential content of concrete or abstract subjects including a technical discussion Be able to communicate spontaneously and fluently
- Be able to express oneself in a clear and detailed manner, to express an opinion on a topical subject

Course contents

For beginners:

- Personal environment (introduce yourself, express yourself, your tastes, your character, your hobbies, etc.), your surroundings (friends, family, location, climate), your interests (sports, leisure)
- Present tense (regular and irregular)
- Language patterns to express habit, obligation, "gustar" and its equivalents, Possessive adjectives
- Differences between "es", "está", "hay" Use of "por" and "para"
- Adverbs and frequency patterns Numeral adjectives

For advanced students:

- Knowledge of the Hispanic world (economic, technical, cultural and social environment) Present tense (regular and irregular)
- Imperative Past tenses
- Direct / indirect style Future tense Conditional tense
- Present and past subjunctive moods

Course material

Preparation manuals, our own tailor-made documents, written and internet press, general civilization documents, digital tools

Assessment

Individual assessment: EVI 1 (coefficient 1)

Language of instruction	ECTS Credits	Lectures	Tutorials	Lab	Project	Exam
English	2	0 hrs	16 hrs	0 hrs	0 hrs	0 hrs

YEAR 2 - Autumn Semester

French Language [FLE3]

LEAD PROFESSOR(S): *Silvia ERTL*

Objectives

The objective is to familiarize the learner with the French language and French culture through an entertaining task-based communicative language teaching, focused on speaking combined with:

- Phonetics
- Self-correcting exercises on our learning platform
- Learning Lab activities
- Project work
- Tutoring

Course objectives include the acquisition and reinforcement of vocabulary, syntax, and pronunciation by both traditional means and through the use of digital resources. Students will learn general French, develop language skills of oral and written comprehension and expression.

After completing this course (32 hours + personal work), the students will be able to communicate in spoken and written French, in a simple, but clear manner, on familiar topics in the context of study, hobbies etc. Another important goal of this course is to introduce the student to French culture.

At the end of the course, complete beginners can achieve an A1 level and some aspects of the A2 of The Common European Framework of Reference for Languages. More advanced students may aim for B1/B2 levels. Those who already completed the first year of the French course will be prepared for working in a French business environment.

Course contents

Two different tracks are proposed: track 1 for students newly arrived at Centrale Nantes and track 2 for students who have completed the first year of the French course.

Track 1:

Full range of practical communication language exercises: reading comprehension, listening comprehension, written expression, oral expression.

Learners will be able to use the foreign language in a simple way for the following purposes:

1. Giving and obtaining factual information:
 - Personal information (e.g. name, address, place of origin, date of birth, education, occupation)

- Non-personal information (e.g. about places and how to get there, time of day, various facilities and services, rules and regulations, opening hours, where and what to eat, etc.)
2. Establishing and maintaining social and professional contacts, particularly:
 - Meeting people and making acquaintances
 - Extending invitations and reacting to being invited
 - Proposing/arranging a course of action
 - Exchanging information, views, feelings, wishes, concerning matters of common interest, particularly those relating to personal life and circumstances, living conditions and environment, educational/occupational activities and interests, leisure activities and social life
 3. Carrying out certain transactions:
 - Making arrangements (planning, tickets, reservations, etc.) for travel, accommodation, appointments, leisure activities
 - Making purchases
 - Ordering food and drink

Track 2:

This track follows on directly from the first-year French course, developing and completing the concepts studied thus far. The main themes are: housing, health and work. These topics will help prepare students for their future work environment. For example, housing is explored in the form of a search for accommodation upon arrival in a new city. Special workshops for CVs and cover letters, elevator pitches and job interviews.

Course material

Preparation manuals, our own tailor-made documents, written and televised press, internet, general civilization documents, digital tools, our own educational materials on Hippocampus (Moodle).

Assessment

Individual assessment: EVI 1 (coefficient 1)

Language of instruction	ECTS Credits	Lectures	Tutorials	Lab	Project	Exam
English	2	0 hrs	16 hrs	0 hrs	0 hrs	0 hrs

YEAR 2 - Spring Semester

Internship / Thesis project [THESIS]

LEAD PROFESSOR(S): Sébastien BOURGUIGNON

Objectives

- Be exposed to and adapt to an industrial or research environment
- Put in practice the scientific and technical skills acquired in the previous semesters
- Strengthen interpersonal and communication skills
- Be part of or manage a project
- Organize tasks, analyze results and build deliverables

Course contents

Students should be pro-active and career-oriented in the search for their thesis/internship. The topics are validated by the program supervisor to ensure an adequate Master level. The thesis/internship is evaluated through the submission of a written report and an oral defense.

Course material
