2023-2024

YEAR 2

---

## CIVIL ENGINEERING

### MATERIALS AND STRUCTURES IN THEIR ENVIRONMENT

---

PROGRAMME SUPERVISOR(S):

Giulio SCIARRA

## YEAR 2 - Autumn Semester

### CORE COURSES

Course code	Title	ECTS Credits
NUMAN	Numerical Analysis	5
PORME	Mechanics of Porous Media	5
PROJT	Project	2
STATI	Statistics of Materials and Structural Reliability	4

### LANGUAGE COURSES

Course code	Title	ECTS Credits
CCE3	Cultural and Communication English	2
ESP3	Spanish Language	2
FLE3	French Language	2

### TRACK: TRACK: MATERIALS

Course code	Title	ECTS Credits
DESIG	Design and Behaviour of Modern Concrete	4
DURAB	Durability and Structural Maintenance	4
HOM	Homogenization Methods in Heterogeneous Media	4

### TRACK: TRACK: STRUCTURES

Course code	Title	ECTS Credits
EARTH	Earthquake Engineering	4
LRGINF	Large Infrastructures of Energy and Transport	4
TSTRUCT	Theory of Structures	4

# YEAR 2 - Spring Semester

---

## CORE COURSES

Course code	Title	ECTS Credits
THESIS	Master Thesis or Industrial Internship	30

# Master Programme - Civil Engineering - Materials and Structures in their Environment

YEAR 2 - Autumn Semester

## Numerical Analysis [NUMAN]

*LEAD PROFESSOR(S): Panagiotis KOTRONIS*

### Objectives

Introduction to numerical analysis and its application in civil engineering.

### Course contents

- Finding the roots of an equation, interpolation, integration, derivatives
- Differential equations
- Solving linear/nonlinear systems
- Time integration schemes
- Least square method
- Finite elements/Finite differences
- Introduction to the discrete element method (DEM) (differential equations of particle motion, contact laws, time integration, contact detection, applications, ...)

Acquired skill: choosing the adequate numerical method.

### Course material

- A. Fortin. Analyse numérique pour l'ingénieur. Edition de l'Ecole Polytechnique de Montréal, 2001.  
 C. O'Sullivan. Particulate discrete element modelling: a geomechanics perspective. Spon Press, 2011.

## Mechanics of Porous Media [PORME]

LEAD PROFESSOR(S): *Giulio SCIARRA*

### Objectives

The lectures cover the characterization of constitutive laws of porous media addressing both the response of soils and concrete.

Thermodynamics is used to identify admissible constitutive laws so as to establish the framework of thermo-hydro-mechanical analysis of (partially) saturated porous media.

Element of poroplasticity are provided.

### Course contents

Introduction to the mechanics of porous media

Thermodynamics & fluid transfer

Thermal effects

Partially saturated porous media

Poroelasticity

Thermo-hydro-mechanical constitutive laws

(Poro-)plastic constitutive laws for soils

(Poro-)viscoelasticity/plasticity

YEAR 2 - Autumn Semester

## Project [PROJT]

*LEAD PROFESSOR(S): Giulio SCIARRA*

### Objectives

The goal is to establish students' attitude to research.

### Course contents

A research project is provided to each student during the first semester on the different topics addressed in the courses.

### Course material

no references

### Assessment

Individual assessment: EVI 1 (coefficient 1.0)

## Statistics of Materials and Structural Reliability [STATI]

LEAD PROFESSOR(S): Franck SCHOEFS / Giulio SCIARRA

### Objectives

Accounting for uncertainties in civil engineering: risk and reliability.

### Course contents

Part 1 - Introduction to probability and reliability in physical space.

- Introduction to random variables and stochastic fields.

Second order variables and iso-probabilistic transformations - Example of typical laws - Random fields properties:

stationarity and ergodicity - Typical autocorrelation function and calculation technique - Maximum likelihood: identification of the parameters characterizing probability distributions and autocorrelation functions

- Probability of failure and reliability index of Rjanytzine-Cornell, the Hasofer-Lind extension.

Statement of a reliability problem starting from the concept of limit state: safety margin, limit state function - Evaluation of the probability of failure in the analytic case - Evaluation of the probability of failure in reference conditions and relation to the Rjanytzine-Cornell reliability index - Proof of the non-general character for a non-linear limit state function - Reliability of Hasofer-Lind

Part 2 - Evaluation of the reliability index in the physical space

- Method of the ellipsoid
- Approximate methods to estimate the probability of failure and errors: Monte-Carlo/ Importance Sampling/RSM

Part 3 - Practical cases with Matlab

- Numerical implementation and simulation of stochastic fields

Part 4 - Reliability index in the standard space

- Independent variables
- Correlated variables

Part 5 - Process of random degradation and reliability

- Introduction
- Basics of reinforced concrete:
- Overview of deterioration of reinforced concrete and corresponding legal issues
- Chloride-induced corrosion: mechanisms, models and parameters
- Corrosion propagation and cracking: mechanisms, models and parameters
- Fatigue of reinforced concrete: mechanisms, models and parameters
- Coupled mechanisms

Part 6 - Optimization

- Formulation of an optimization problem
- Cost function - Optimization parameters - Optimization constraints - Example of optimization problems
- Fundamental optimization concepts
- Global and local minima - Taylor polynomial expansion - Gradient Vector and Hessian matrix - Optimality conditions
- Linear optimization problems
- Formulation of the linear programming problem - Simplex algorithm in linear programming

- Unconstrained nonlinear optimization
  - Study of the optimality condition on some functions - Mechanical Examples of unconstrained minimization
  - Constrained nonlinear optimization problems
- Equality constraints: Lagrange multipliers - Inequality constraints

#### Part 7 - Limit Analysis

- (Handout) Continuum mechanics: stress vector, stress tensor, Boundary conditions, stress eigen value and vectors, Bidimensional stress state, Mohr plane and Mohr circles, Normal stress and tangential stress, Local equilibrium equation
  - (Handout) General concepts of plasticity: Notions of elastic limit, Partition to reversible and irreversible strains, bounding surface, Isotropic flow criteria, Anisotropic flow criteria, failure criterion, Loading and unloading criterion, Plastic flow law, Plastic potential, Work hardening modulus and plastic multiplier.
  - Bars plasticity: Local equilibrium equation, Generalized behavior laws of beams, Failure state of beams
  - Fundamental theorems in plasticity
- Internal and external variables - Internal and external generalized variables - Principle of virtual work - Theorem of maximal plastic work of Hill - Static approach: Lower bound theorem - Kinematic approach: Upper bound theorem

# Master Programme - Civil Engineering - Materials and Structures in their Environment

YEAR 2 - Autumn Semester

## Cultural and Communication English [CCE3]

*LEAD PROFESSOR(S): David TROYA*

### Objectives

Team-building and Communicational English:

- Understand the general concepts of team-building
- Build a team-building project
- Understand and nurture the creative process
- Enhance self-belief and self-empowerment

Behavioral skills in an inter-cultural environment:

- Strengthen self-confidence and capacity for interaction
- Develop active listening and reformulation skills
- Develop networking skills

### Course contents

Cultural and Communicational English: exercises to explore in practice the areas of culture and communication  
 Field-related or inter-cultural project.

### Course material

Written and televised press, information and digital tools, general documents business environment and company strategies.  
 Internet conferences (Ted Talks, etc.), our own educational materials on Hippocampus (Moodle).

### Assessment

Individual assessment: EVI 1 (coefficient 1.0)

LANGUAGE OF INSTRUCTION	ECTS CREDITS	LECTURES	TUTORIALS	LAB	PROJECT	EXAM

# Master Programme - Civil Engineering - Materials and Structures in their Environment

YEAR 2 - Autumn Semester

## Spanish Language [ESP3]

LEAD PROFESSOR(S): Marta HERRERA

### Objectives

For beginners:

Practice and reinforcement of the five skills (oral and written expression and comprehension as well as interaction)

Acquisition of vocabulary and linguistic structures

Be able to talk about yourself and those around you

Be able to express oneself during daily activities

Know how to give your opinion

For advanced students:

Practice and reinforcement of the five skills (oral and written expression and comprehension as well as interaction)

Acquisition of specialised vocabulary

Be able to understand the essential content of concrete or abstract subjects including a technical discussion

Be able to communicate spontaneously and fluently

Be able to express oneself in a clear and detailed manner, to express an opinion on a topical subject

### Course contents

For beginners:

Personal environment (introduce yourself, express yourself, your tastes, your character, your hobbies, etc.), your surroundings (friends, family, location, climate), your interests (sports, leisure)

Present tense (regular and irregular)

Language patterns to express habit, obligation, "gustar" and its equivalents,

Possessive adjectives

Differences between "es", "está", "hay"

Use of "por" and "para"

Adverbs and frequency patterns

Numeral adjectives

For advanced students:

Knowledge of the Hispanic world (economic, technical, cultural and social environment)

Present tense (regular and irregular)

Imperative

Past tenses

Direct / indirect style

Future tense

Conditional tense

Present and past subjunctive moods

### Course material

Preparation manuals, our own tailor-made documents, written and internet press, general civilization documents, digital tools

### Assessment

Individual assessment: EVI 1 (coefficient 1)

LANGUAGE OF INSTRUCTION	ECTS CREDITS	LECTURES	TUTORIALS	LAB	PROJECT	EXAM

# Master Programme - Civil Engineering - Materials and Structures in their Environment

YEAR 2 - Autumn Semester

## French Language [FLE3]

LEAD PROFESSOR(S): *Silvia ERTL*

### Objectives

The objective is to familiarize the learner with the French language and French culture through an entertaining task-based communicative language teaching, focused on speaking combined with:

- Phonetics
- Self-correcting exercises on our learning platform
- Learning Lab activities
- Project work
- Tutoring

Course objectives include the acquisition and reinforcement of vocabulary, syntax, and pronunciation by both traditional means and through the use of digital resources. Students will learn general French, develop language skills of oral and written comprehension and expression.

After completing this course (32 hours + personal work), the students will be able to communicate in spoken and written French, in a simple, but clear manner, on familiar topics in the context of study, hobbies etc. Another important goal of this course is to introduce the student to French culture.

At the end of the course, complete beginners can achieve an A1 level and some aspects of the A2 of The Common European Framework of Reference for Languages. More advanced students may aim for B1/B2 levels. Those who already completed the first year of the French course will be prepared for working in a French business environment.

### Course contents

Two different tracks are proposed: track 1 for students newly arrived at Centrale Nantes and track 2 for students who have completed the first year of the French course. Track 1:

Full range of practical communication language exercises: reading comprehension, listening comprehension, written expression, oral expression.

Learners will be able to use the foreign language in a simple way for the following purposes:

1. Giving and obtaining factual information:

- personal information (e.g. name, address, place of origin, date of birth, education, occupation)
- non-personal information (e.g. about places and how to get there, time of day, various facilities and services, rules and regulations, opening hours, where and what to eat, etc.)

2. Establishing and maintaining social and professional contacts, particularly:

- meeting people and making acquaintances
- extending invitations and reacting to being invited
- proposing/arranging a course of action
- exchanging information, views, feelings, wishes, concerning matters of common interest, particularly those relating to personal life and circumstances, living conditions and environment, educational/occupational activities and interests, leisure activities and social life

3. Carrying out certain transactions:

- making arrangements (planning, tickets, reservations, etc.) for travel, accommodation, appointments, leisure activities
- making purchases
- ordering food and drink

### Track 2:

This track follows on directly from the first-year French course, developing and completing the concepts studied thus far. The main themes are: housing, health and work. These topics will help prepare students for their future work environment. For example, housing is explored in the form of a search for accommodation upon arrival in a new city. Special workshops for CVs and cover letters, elevator pitches and job interviews.

### Course material

## Design and Behaviour of Modern Concrete [DESIG]

LEAD PROFESSOR(S): Ahmed LOUKILI

### Objectives

The aim of the course is to provide knowledge of the physical, chemical and mechanical properties of materials used in the composition of concrete and teach standard practices for its formulation for a better mechanical behavior.

Skill: mix design of concrete in order to have the best mechanical and durability behaviors.

### Course contents

- Cement hydration in the presence of mineral additives.
- Cement hydration.
- Physical consequences of cement hydration.
- Microstructure of the cement paste.
- Deferred concrete behavior: shrinkage and creep.
- Theoretical basis for the formulation of concrete.
- Basics of formulation of modern concretes and for a reliable environmental impact.
- Fracture mechanics of concrete
- Advanced experimental methods

### Course material

A. Neville " Properties of concrete" Ed. Eyrolles

### Assessment

Individual assessment: EVI 1 (coefficient 1.0)

LANGUAGE OF INSTRUCTION	ECTS CREDITS	LECTURES	TUTORIALS	LAB	PROJECT	EXAM
English	4	22 hrs	8 hrs	0 hrs	0 hrs	2 hrs

## Durability and Structural Maintenance [DURAB]

LEAD PROFESSOR(S): Abdelhafid KHELIDJ / Giulio SCIARRA

### Objectives

The goal of the course is, on the one hand, the identification of the nature of a problem of durability, and on the other, the optimal choice of composition and type of concrete.

### Course contents

#### Part 1 – Durability

- Reminders: Presentation of concrete - Hydration reactions and various compounds
- General approach to concrete durability: Corrosion - Sulphate attack - Alkali aggregate reaction - Frost
- Permeability: Darcy Law - Poiseuille law - How to measure permeability - Klinkenberg effect - Forsheimer law - Effect of damage - Effect of crack - Effect of temperature - Effect of saturation
- Chloride Diffusion: Fick's laws (1st and second) - Bound and free chloride - How to measure chloride diffusion? (Steady state / Unsteady state) - Migration and Nernst-Planck law - Effect of temperature - Effect of crack
- Carbonation: When and where? - The condition for carbonation in concrete - How to measure the depth of carbonation?

#### Part 2 - Experimental aspects and Macroscopic modelling of chloride transfer in cementitious materials

- Mechanisms involved during chloride ingress (chloride binding, electrostatic interaction, Electrical Double Layer (EDL), activity of pore solution)
- Approaches to modelling chloride transfer in saturated concrete: Mono specie Approach (Modified Fick's Law) - Multi species Approach based on Nernst-Planck equation - Multi species approach with consideration of EDL Approaches of modelling of chloride transfer in saturated concrete
- Initiation to chloride transfer in unsaturated concrete

#### Part 3 - Structural maintenance

- Context on NDT: Specificity of NDT, Employment situations and requirements - Implementation of NDT versus management cases - French associations promoting NDT quality
- Generality on NDT: Non-Destructive Testing aims – Vocabulary - Inverse problem
- Basics of ultrasonic methods: Basics of wave propagation (elastic homogeneous linear isotropic) - Geometry characterization - Material properties characterization
- Classical US techniques (transmission, refraction, ultrasonic pulse echo, impact echo): principle and experimental set-up - signal processing - example of results
- Advanced US methods (tomography, surface wave, coda wave): principle and experimental set-up - signal processing - example of results
- Ground Penetrating Radar technique: Physical Principle - Data processing - Civil engineering applications
- Electromagnetic NDT techniques: Low frequency technique - Infra-red technique - Gammagraphy

#### Part 4 - Performance-based specifications

- Context of durability and why performance-based specifications are needed: Examples - Delayed ettringite formation - Shrinkage-induced cracking
- Deemed-to-satisfy provisions: Standards - Minimum cover - Exposure classes
- Performance-based approach of durability: Carbonation – Chlorides – Leaching - External sulphate attacks

## Homogenization Methods in Heterogeneous Media [HOM]

*LEAD PROFESSOR(S): Giulio SCIARRA*

### Objectives

These lectures deal with characterising the behaviour of heterogeneous materials (in particular porous materials) by means of upscaling methods. Upscaling techniques calculate estimates of the behavior of the material parameters from the material behaviour of its constituents and their geometric distribution (the so-called micro-structure of the material). The purpose of this course is to introduce students to upscaling techniques.

### Course contents

The main elements covered in lectures are:

- Microstructural descriptors.
  - n-Point Probability Functions.
  - Ensemble averages.
  - Ergodic hypothesis & statistical homogeneity.
  - Scale separation.
  - Representative Volume Element (RVE).
- Quantitative definition of the RVE size.
- Averaging operations and applications to the balance laws.
- Concentration & Homogenization.
  - Uniform stress (strain) boundary conditions. Hill Lemma. Reuss and Voigt bounds.
  - Classical homogenization schemes: micro-elasticity & micro-poroelasticity.
- Double-scale expansion & periodic homogenization.
  - Asymptotic expansions.
  - Incompressible Newtonian fluid flow through a rigid porous medium: the Darcy law.
  - Quasi-statics of saturated deformable porous media.
- Random homogenization.
- Numerical homogenization methods.

# Master Programme - Civil Engineering - Materials and Structures in their Environment

YEAR 2 - Autumn Semester

## Earthquake Engineering [EARTH]

LEAD PROFESSOR(S): Panagiotis KOTRONIS

### Objectives

Dynamic behavior of structures, soil dynamics, nonlinear calculations and design of earthquake-resistant structures.

### Course contents

#### Part I - Dynamics of structures

- Seismic risk, seismic hazard
- Dynamic equation of a simple oscillator, solving the equation
- Dynamic equation of a multi-degree-of-freedom structure, solving the equation
- Modal analysis, modal superposition technique, modal spectrum analysis
- Earthquake-resistant structure design according to EC8, capacity design
- Nonlinear calculations
- Introduction to nuclear plant design

#### Part 2 - Soil dynamics and geotechnical earthquake engineering

- Dynamic soil properties
- Ground motion parameters
- Wave propagation
- Ground response analysis
- Soil liquefaction
- Seismic slope stability
- Seismic design of foundations

Acquired skill: Calculating a structure submitted to earthquake loading.

### Course material

Dynamique des structures - Application aux ouvrages de génie civil, Patrick Paultre, Hermès, Lavoisier, 2004.

## Large Infrastructures of Energy and Transport [LRGINF]

LEAD PROFESSOR(S): *Didier MAROT*

### Objectives

The lectures cover the main pathologies of hydraulic earth structures and concrete structures dedicated to energy production or the transport and some impact on the environment.

### Course contents

Part 1, earth structures:

- Earth dams and dikes: types and main instabilities
- Bank sliding process
- External and internal erosion processes
- From the specimen to the structure, by considering:
  - spatial scale effect on physical parameter
  - spatial variabilities
- Environmental impact in relation with the use of dredged sediments

Part 2, offshore wind turbines:

- Offshore Wind Turbine Foundations
- Soil-pile Interaction
  - Axial response
  - Lateral response
    - Uni-directional monotonic loading
    - Uni-directional cyclic loading
    - Multi-directional cyclic loading
- Design standards/recommendations
  - DNVGEL
  - API
  - CFMS

Part 3, concrete structures:

- Reinforced Concrete Structures (quay, bridges and Offshore Floating Wind Turbines OFWT) in the marine environment: main instabilities
- Maintenance: Inspection on site and laboratory measurements
- Repair
- Prediction
- Examples: quay of GPNSN, bridge

### Course material

## Theory of Structures [TSTRUCT]

LEAD PROFESSOR(S): Panagiotis KOTRONIS

### Objectives

The lectures deal with the theory of structures typically found in civil engineering, say beam-like (1D), shell-like (2D) and masonry (3D) structures. The more general approach of micromorphic continua is also discussed showing how the previous theories can be regarded as special cases of this more general framework. The finite element for beam and plate structures is also presented.

The objective of the lectures is on the one hand that of presenting typical engineering models of structures characteristic of civil engineering (using a quite sophisticated theoretical framework), and on the other, to introduce master students to non-standard or enhanced theories of continua.

### Course contents

- Beam-like structures:
  - o Beam-like domain: one-dimensional modelling
  - o Static of beams
  - o Structures formed of curvilinear elements
  - o Finite element method (Euler-Bernoulli and Timoshenko beams, multifiber beams)
- Shell-like structures:
  - o Shell like domains: two-dimensional modelling
  - o Surfaces and curves, first and second fundamental forms, curvature. Integration along the thickness. Differential operators in curvilinear coordinates.
    - o Kinematics
    - o The Kirchhoff-Love hypothesis, examples: plate, cylindrical & spherical shell.
    - o State of stress
    - o Stress characteristics, examples: plate, cylindrical & spherical shell.
    - o Balance laws given in terms of forces and couples
    - o Finite element method
- Masonry structures
  - o Equivalent 3D continua and homogenization.
- Micromorphic & Cosserat continua

# Master Programme - Civil Engineering - Materials and Structures in their Environment

## YEAR 2 - Spring Semester

## Master Thesis or Industrial Internship [THESIS]

LEAD PROFESSOR(S): *Giulio SCIARRA*

### Objectives

- Be exposed to and adapt to an industrial or research environment
- Put in practice the scientific and technical skills acquired in the previous semesters
- Strengthen interpersonal and communication skills
- Be part of or manage a project
- Organize tasks, analyze results and build deliverables

### Course contents

The thesis/internship is evaluated through the submission of a written report and an oral defense.
